ABSTRACT

The report discusses and presents tables of statistical data related to the voting rate in the 1976 Presidential election. Focusing upon social and demographic characteristics of the civilian noninstitutional population of voting age in 1976, the report presents data by age, race, sex, family income, education, geographic region, household relationship, and marital status. Data were taken from the Current Population Survey (CPS) conducted by the Bureau of the Census. Highlights of the report include: (1) the voting rate in the 1976 Presidential election was lower than in any Presidential election since 1948, in spite of the fact that more people voted than ever before; (2) an increase in the proportion of the electorate under 35 years old (traditionally, a low-turnout age group), has contributed to the decline in voter turnout since the 1964 Presidential election; (3) the voting rates of men and women are now approximately equal; (4) voting turnout for both whites and blacks in 1976 was about 10 percentage points below their respective levels in the 1964 election; (5) voting turnout for persons of Spanish origin was six percentage points below that of 1972. Information is presented on source and reliability of the data, related reports, definitions and explanations, and voting in previous elections. (Author/DB)

Voting and Registration in the Election of November 1976

INTRODUCTION

Although more people voted than ever before, the actual voting rate in the 1976 Presidential election was lower than in any Presidential election since 1948. The ratio of official votes cast for President to the voting age population was 54 percent, down from 55 percent in 1972 and a high of 63 percent in 1960.

This report presents findings on the social and demographic characteristics of the civilian noninstitutional population of voting age in the 1976 election from the Current Population Survey (CPS) conducted by the Bureau of the Census. (Preliminary results were published in P-20, No. 304.) Comparisons of reported voter turnout are made with the first CPS survey on voting in 1964 and with the previous Presidential election of 1972.

The low official turnout for 1976 is also reflected in results of the CPS. Voter participation in 1976, as reported by the survey, was around 4 percentage points below the 1972 Presidential election and 10 points below the election of 1964.

HIGHLIGHTS

- Changes in the age distribution of the voting age population have contributed to the decline in voter turnout since the 1964 Presidential election.
- The voting rates of men and women are now approximately equal. Between 1964 and 1976 the reported rate for men dropped from 72 percent to 60 percent, while the rate for women fell from 67 to 59 percent.
- Voting turnout for both Whites and Blacks in 1976 was about 10 percentage points below their respective levels in the 1964 election, whereas the figure for persons of Spanish origin was 6 points below that of 1972, the first year the Bureau of the Census obtained voting data for this group separately.

Voting by Age. A significant part of the decline in the voting rate since 1964 can be attributed to an increase in the proportion of the electorate under 35 years old—traditionally, a low-turnout age group. During the 12 years since 1964, this portion of the voting age population increased from 28 percent to 40 percent of the total, an increase of 28 million persons. About 11 million of these young persons entered the electorate for the first time for the 1972 Presidential election, following ratification of the 26th Amendment. In addition, the under 35-year-old age group grew by 7 million between 1972 and 1976 because of natural increase (tables A and 1).

Besides the large increase in the number of young eligibles, voter turnout has been affected by the relatively small (10 percent) increase since 1964 in the number of persons in the high turnout, over 35, age group. In 1976, the number of persons 35 to 54 years old was nearly the same as in 1964—about 46 million in each year—while the number of persons 55 years old and over increased by about 8.1 million. The modest increase in the size of the older age group, combined with a drop in their reported voting rate, resulted in a total turnout for persons 35 and over in 1976 that was nearly identical with the turnout for persons of this age in 1964 (about 58 million voters in each year). Thus, despite the lower voting rate of persons under 35 years old, the increase in the number of persons of that age contributed nearly all of the 10 million increase in the total reported votes cast in 1976 over 1964.

The net effect on voter turnout of all changes in the age distribution of the voting age population since 1964 indicates that about 3 out of the 10 percentage point drop in turnout since 1964 can be attributed to changes in the age distribution of the electorate.

Voting by Education and Employment. The decline in turnout between 1964 and 1976 occurred among men and women, both Black and White races, all age groups, and persons of every educational level and almost every occupational level (tables A and B). The drop in reported turnout for persons who attended high school but not college was 17 percentage points. Among college graduates, turnout was about 8 points lower in 1976 than it had been in 1964. However, during this time, there had been an increase in the proportion of the voting age population in the upper educational categories (high school graduates and above) and a decrease in the proportion in the lower educational levels, where turnout is generally low.

Between 1964 and 1976, the proportion of employed persons in white-collar occupations increased from 45 to 51 percent, while the proportion in blue-collar occupations declined from 37 to 33 percent. During the same period, the reported voting rate dropped by 10 percentage points for white-collar workers and by 16 points for blue-collar workers. Even though changes occurred in the educational and occupational distribution of workers that could have contributed to a higher turnout in 1976, no such increase occurred.

Table A. Percent Reported Voting, by Sex, Race, Spanish Origin, and Age: November 1976 and 1964

(Civilian noninstitutional population. For meaning of symbols, see text)

Sex, race, Spanish origin, and age	1976	1964	Difference
Both sexes	59.2	69.3	-10.1
Men	59.6	71.9	-12.3
Women	58.8	67.0	-8.2
White	60.9	70.7	-9.8
Black	48.7	58.5	-9.8
Spanish origin[1]	31.8	(NA)	...
Under 35 years	49.3	60.3	-11.0
18 to 20 years	38.0	[2]39.2	-1.2
21 to 34 years	52.3	60.5	-8.2
35 years and over	65.7	72.9	-7.2
35 to 54 years	65.6	74.4	-8.8
55 years and over	65.8	70.8	-5.0

[1]Persons of Spanish origin may be of any race.

[2]Comprised of the populations 18 to 20 years old in Georgia and Kentucky, 19 and 20 years in Alaska, and 20 years in Hawaii.

Table B. Percent Reported Voting by Years of School Completed and Occupation of the Employed: November 1976 and 1964

(Civilian noninstitutional population. For meaning of symbols, see text)

Years of school completed and occupation	1976	[1]1964	Difference
All educational levels	59.2	69.4	-10.2
Elementary: 0 to 7 years	37.3	51.2	-13.9
8 years	51.4	67.0	-15.6
High school: 1 to 3 years	47.2	65.4	-18.2
4 years	59.4	76.1	-16.7
College: 1 to 3 years	68.1	82.1	-14.0
4 years or more	79.8	87.5	-7.7
Not reported	...	34.1	...

White-collar workers	72.1	82.1	-10.0
Blue-collar workers	49.8	65.6	-15.8
Service workers	52.8	65.9	-13.1
Farm workers	62.5	63.8	-1.3

[1]Persons 21 years old and over in 1964.

Black-White Voting Rates.

In the 1976 survey, the reported voting rate for Blacks was 49 percent and for Whites, 61 percent. Most of this 12 point difference, however, can be attributed to differences in the age, education, and income distributions of the Black and White populations. For example, by applying Black voting rates and White voting rates within education and age groups to a standard population (all persons 18 years old and over), the voting rates for Blacks and Whites become much closer—58 and 60 percent, respectively (table C). A similar standardized computation for age and family income of primary family members produces Black and White voting rates that also differ by only about 4 points. Further, if both education and income are standardized, the difference in voting rates is reduced to about 2 percentage points.

Voter Consistency Between 1972 and 1976.

A comparison of the two most recent Presidential elections reveals that the lower turnout of 4 percentage points in 1976 was not evenly distributed among demographic and social categories. Persons under 35 years of age reported a voting turnout rate in 1976 which was about 6 points below their participation rate in the earlier election. High school graduates and those with some college education dropped more than the national average, whereas non-high school graduates and college graduates declined by about the same amount. The rates for men declined more than the rates for women, while Blacks and Whites declined about the same amount. Counter to the national trend, nonmetropolitan areas of the South showed increased voter participation by 4 percentage points (table 3).

A net change figure for turnout between two elections may imply more stability in voting patterns than exists in reality. Although the potential electorate is made up of approximately the same persons from one election to the next, some changes do occur: people die, a new 4-year cohort becomes eligible to vote, some people leave the country, others move in, and some enter the Armed Forces and institutions while others are discharged. (The CPS is restricted to the civilian noninstitutional population.) Aside from these changes, people who vote in one Presidential election may not vote in the next one for a variety of reasons, such as, dislike of the major candidates, failure to register in time, and ill health; they may vote in a later election when they had previously abstained. When persons 22 years of age or older in 1976 (who were eligible on the basis of age to vote in 1972) were asked about their voting in that election,

Table C. Reported and Standardized Percent Voting of Person of Voting Age, by Race and Education: November 1976

(Numbers in thousands. Civilian noninstitutional population)

4 years	59.4	65.4	-6.0
College: 1 to 3 years	68.1	74.9	-6.8
4 years or more	79.8	83.6	-3.8

[1] Persons of Spanish origin may be of any race.

a substantial majority reported the same behavior in 1972 as in 1976 (table E). Thus, 62 percent claimed to have voted in both elections and 20 percent did not vote in either. Another 18 percent reported different voting patterns; 10 percent said they had voted in 1972, but not in 1976, while 7 percent reported they had voted in 1976, but not in the earlier election.[1]

Higher educational levels were highly correlated with a tendency to have voted in both elections. Eighty-five percent of those who completed 5 years or more of college reported that they voted in both the 1972 and 1976 elections, whereas only 4 percent reported that they did not vote in either election. In contrast, of persons who did not go beyond the 4th grade, 34 percent reported that they had voted in both elections and 50 percent reported not voting in either election.

Similarly, older persons 55 to 64 years old were more likely to have voted in both elections. Younger persons 22 to 24 years of age, besides having a greater proportion not voting in either election (37 percent) than in both elections (34 percent), also had the largest proportion (17 percent) who voted in 1976 but did not vote in 1972. This fact illustrates the gradual way in which the young, in general, involve themselves in the political process. However, this statement should be qualified by noting the substantial difference that education makes in increasing the voting participation of those under 25 years of age. Young college graduates voted at a rate of 72 percent, compared with 38 percent for high school graduates, and 18 percent for those with less education (table 10).

Nonvoters (citizens only) in 1976 were asked if they had ever voted in a national, State, or local election and, if so, when they last voted. Among the 22 percent of nonvoters who were registered in 1976, 61 percent were reported to have voted at least once between 1972 and 1976; 10 percent had last voted before 1972, and 17 percent had never voted. Of the nonvoters in 1976 who were also not registered, there was considerably less involvement in elections. Only about 19 percent had voted in recent years (1972 or more recently); 16 percent had not voted since before 1972, and 54 percent had never voted (table 21).

The group who had voted before 1972, but not since, in contrast to those who had never voted, was predominantly older and likely to have had less schooling. Thus, those who had never voted by 1976 appear to be younger and gradually working their way into the political process, whereas the more recent nonvoters are older and slowly dropping out.

[1] These percentages are based on those reporting for 1976 and 1972; 11 percent were not reported or did not know whether they had voted in 1972.

Table E. Percent Reported Voting in 1976 and 1972 of Persons 22 Years Old and Over, by Age and Years of School Completed: November 1976

(Numbers in thousands. Civilian noninstitutional population)

Age and education	Persons 22 years and over [1]	Voted in 1976		Did not vote in 1976

[1] Persons reporting on voting for 1976 and 1972.

Women and Voting. The gap between men and women in reported voting participation has narrowed significantly since this series of voting surveys began in 1964. In that year, the reported voting rate for men was 72 percent and for women 67 percent. This difference diminished to about 1 percentage point by 1976.[2] In fact, women under age 45 voted at a slightly higher rate than men in these same age groups. Among the elderly, those 65 and older, however, men voted at a rate that was 10 percentage points higher than women (68 to 58 percent). There was some evidence that among Black voters, women voted at a higher rate than men; this was clearly true for the age group 25 to 54 where the voting turnout for females was 5 percentage points above that for males (table 1).

Despite the near equality in voting rates between men and women, overall, there is some variation between the sexes according to educational attainment. The voting participation rates for those with an elementary school education or less have traditionally been low,[3] but women who did not go beyond the 8th grade voted at a rate which averaged about 9 percentage points lower than men with comparable education. The voting participation of women at higher educational levels increased so that for high school graduates and above, women reported voting at a higher rate than men. However, among the small group of persons with more than 4 years of college, comparison of the voting rates of men and women revealed some evidence of a higher voting rate for women. When age and educational attainment are considered together, women under 45 with at least a high school education voted at a higher rate than comparable men in the 1976 election (see table 10).

Except in the age groups under 25 and among women over 65, married persons, were more likely to report voting in 1976 than were never-married persons. Married men voted at slightly higher rates than married women, whereas widowed and divorced women, and never-married women were more likely to vote than their male counterparts. At age 65 and above, married men voted at a level that was 6 percentage points above that for married women. Widows and widowers, who among the elderly dominate the combined widowed and divorced category, voted at about the same rates, around 50 percent. The fact that there are more than five times as many widows who are age 65 and above helps to explain the disparity in voting turnout between elderly men and women (table 8).

[2] In terms of actual numbers, women cast more ballots than men in 1976, 45.6 million to 41.1 million, according to the survey estimate.

[3] See Current Population Reports, Series P-20, Nos. 293, 253, 228, 192, 174, and 143.

Husbands and wives were more likely to have exhibited similar voting behavior in the 1976 election, in the sense of either both voting (61 percent) or both not voting (25 percent), than to have behaved differently[4] (table F). In about 8 percent of the husband-wife households, the husband voted but his wife did not, and in about 6 percent, the wife voted while her husband did not. These figures varied considerably by the amount of education of the husband. If the husband had not completed elementary school, only 39 percent of both spouses voted in the election. If the husband was a college graduate, 80 percent of both husbands and wives voted. As their level of education increased, the proportion of marital partners who differed in their voting participation declined. For husbands with less than 8 years of schooling, about 20 percent of husbands and wives reported different voting activity on election day, whereas the comparable figure for households in which the husband had attended college was only 9 percent. Where there was a disparity in education, and only one of the spouses had voted, the partner with the greater amount of education was the one more likely to vote. For example, women who had completed high school, attended some college, or completed college and whose spouses had not received as much schooling, were more likely than their husbands to have voted in the 1976 election.

In summary, the difference between men and women in voting participation that was observed in the Presidential election of 1964 has virtually disappeared. Among young persons and high school graduates, women exceeded men in voting turnout in 1976. Only among the elderly did men maintain a higher voting rate. Most men who are 65 and over are married and maintain a high voting rate, whereas a larger proportion of elderly women are widows and exhibit a diminished participation in elections.

[4] This analysis is based on the reported voting behavior of husbands and wives and does not consider other household members of voting age.

EVALUATION OF THE ACCURACY OF THE DATA

In the November 1976 Current Population Survey supplement on voting, 86.7 million of the 146.5 million persons of voting age in the civilian noninstitutional population were reported (by themselves or by members of their households) as having voted in the November 1976 election. Official counts showed 81.7 million votes cast for President, or a difference of 5.0 million votes between the two sources. This difference is greater than can be accounted for by sampling variability. Moreover, the population covered in the survey excluded members of the Armed Forces and institutional inmates.[5] Since the proportion of voters in these population groups is somewhat lower than in the rest of the population, their omission leads to a minor understatement of the size of the difference.

This bias has been noted in other surveys of voting behavior but both the methods of measuring it and estimates of its size have varied considerably.[6] On balance, the over-

[5] In the November 1974 Congressional election, the Department of Defense total voting rate for Armed Forces was 18.0 percent as compared with 44.7 percent for the civilian noninstitutional population; in the 1972 Presidential election, the corresponding voting rate for the Armed Forces was 47.6 as compared with 63.0 percent for the civilian noninstitutional population. Table F. Percent Reported Voting of Family Heads and Wives, by Years of School Completed by Head: November 1976

(Numbers in thousands. Civilian noninstitutional population)

Education of family head	All heads and wives reporting on voting		Head voted		Head did not vote	
	Number	Percent	Wife voted	Wife did not vote	Wife voted	Wife did not vote
All educational levels	44,992	100.0	60.8	8.1	6.5	24.6
Elementary: 0 to 7 years	4,140	100.0	38.8	10.6	9.0	41.6
8 years	4,084	100.0	53.4	10.2	7.0	29.4
High school: 1 to 3 years	6,527	100.0	50.1	8.5	7.9	33.4
4 years	15,202	100.0	59.2	8.3	6.9	25.5
College: 1 to 3 years	6,672	100.0	68.5	7.9	5.6	18.1
4 years or more	8,367	100.0	80.2	5.5	3.9	10.4

Table G. Comparisons of CPS Voting Estimates and Official Counts of Votes Cast, November 1964 to 1976

(Numbers in millions)

Year	CPS vote for President	Official vote for President[1]	Percent difference
1976	85.9	81.7	5.1
1972	84.6	77.6	9.0
1968	78.5	73.0	7.5
1964	[2]76.7	70.6	8.6
	CPS vote for U.S. Representative	Official vote for U.S. Representative or highest office[1]	Percent difference
1974	[2]63.2	[3]56.0	12.9
1970	[2]65.9	[3]58.0	13.6
1966	57.6	[1]52.9	8.9

[1]U.S. Congress, Clerk of the House, Statistics of the Presidential and Congressional Election.
[2]CPS estimate of total votes cast.
[3]The "official vote" was obtained by summing the number of votes cast for U.S. Senator, U.S. Representative, or Governor in each State, depending on which office received the highest number of votes.

statement varies between 5 and 10 percent of the total number of persons reported as having voted.[7] Possible reasons for the differences include:

1. **Understatement of total votes cast.** The only uniform count of the total number of voters available on a nationwide basis is the number of votes cast for President. This number is smaller than the total number of persons who voted because (a) a number of ballots are invalidated in the counting and (b) there are a number of valid ballots for which there was no vote cast for President. Precise estimates of the size of these sources of error are not available. Although the office of the President usually attracts the largest number of votes, not everyone who goes to the polls casts a vote for President. Some persons may, for example, vote for a U.S. Senator or member of the U.S. Congress but not for President. A tally of the data from the States which report information on the total number of votes cast shows that there were about 2 percent fewer votes cast for President than the total number voting in the election.

2. **Overreporting of voting in the survey.** Some persons who actually did not vote were reluctant to so report, perhaps because they felt it was a "lapse in civic responsibility" and some respondents reporting on the voting behavior of other members of their household assumed the person in question had voted when, in fact, he or she had not. This latter problem may be especially relevant to reported voting of 18- to 20-year-olds, inasmuch as only about a quarter of this age group reported for themselves. Those away at college were almost certainly reported for by their parents. In addition, since men are more likely to be employed and at their jobs when the enumerator visits their home, another household member, usually the wife, is likely to report for them.

As a check on the work of the interviewer, a subsample of the households in the 1964 survey was reinterviewed by the supervisory staff. This reinterview showed no net error in reporting on voting. However, since the reinterviewer usually talked with the same household respondent (or respondents) as originally interviewed the previous week, it is likely that an original reporting error of this type would go undetected during a reinterview.

A test was conducted in conjunction with the December 1972 Current Population Survey to examine another facet of the overreporting problem. The hypothesis was that by

[7]For a comprehensive discussion of the problem, including a comparison of the 1964 Bureau of the Census survey with that conducted by the Survey Research Center of the University of Michigan, see Aage R. Clausen, "Response Validity: Vote Report," Public Opinion Quarterly, Vol. XXXII, No. 4, Winter 1968-69, pp. 588-606.

asking the presumably less sensitive question on registration first, the tendency to overreport on voting might be lessened. The results of this test were somewhat confounded by a nonreporting rate in December that was twice as high as that in November, 4.2 percent compared with 1.9 percent. However, when the comparison was restricted to those who reported on voting, the study indicated that reversing the question order does not reduce the proportion of persons who report that they had voted.

3. **CPS estimating procedure.** A part of the difference between the official count of votes for President and the CPS estimate could be due to the estimation procedures in the CPS which essentially attribute the characteristics of interviewed persons to persons in noninterviewed households of similar types—about 4 percent of the total. This procedure may have a substantial effect on the results of a survey of voting if the noninterviewed households have a higher proportion of nonvoting members than interviewed households.

4. **CPS coverage.** An additional factor that increases the estimate of voters derives from the coverage of the CPS sample. There is evidence that the sample is less successful in representing certain groups in the population in which nonvoting may be expected to be high, for example, Black-and-other-races males 21 to 24 years of age. In addition, the CPS results are adjusted to independent population estimates based on the decennial census. Insofar as the census was also subject to net undercounts in selected age groups, this source of error will be reflected in estimates from the CPS.[8]

5. **Household respondent.** A portion of the difference between the official count and the survey results might be attributable to the use of a household respondent to report on the registration and voting of all eligible household members. An experiment was conducted in conjunction with the November 1974 CPS to assess the effects of proxy respondents on the voting rate. In approximately one-eighth of the sample households, interviewers were instructed to obtain the voting supplement information from each individual directly. For the entire sample, 57 percent of all interviewed persons reported for themselves, as compared with about 76 percent for the test group. The differences between groups reporting for themselves or someone else were not significant. Thus, there is no evidence that obtaining voting and registration information for all household members from one respondent rather than from self-respondents only accounts for any part of the overestimates of voters obtained in household surveys.

6. **Nonreports on voting.** In 1966 a "do not know" category in each question of the voting survey was introduced (and retained in all subsequent surveys) on the theory that forcing people into a "yes-no" alternative might have been responsible for increasing the number of persons reported as voting. The introduction of the "do not know" category increased the overall proportion of those for whom a report on voting was not obtained from 1 percent in 1964 to 3 percent in 1966. Among Blacks the figure rose to almost 6 percent. The lower nonresponse figure from the 1964 report may have resulted in part from the fact that the "yes-no" alternative forced respondents to give answers which more properly should have been classified as "do not know."

Although there is no evidence that answers by proxy respondents account for the overreporting on voting, the value of asking people about their own behavior on such matters as voting and registering to vote can be shown by comparing the effect of self reports and reports by others on the "do not know" rate for whether voted in the election and whether registered to vote. For self-respondents, the "do no know" categories were almost nonexistent. At the other extreme, 3 percent of respondents who reported on the voting behavior of other household members could not answer whether the other persons had voted. Among Blacks the corresponding figure was 9 percent (table H).

Table H. Percent of the Population of Voting Age Who Reported "Do Not Know" to the Question on Voting, by Race and Type of Respondent: November 1976

Type of respondent and race	"Do not know" responses	
	Whether voted	If did not vote, whether registered
All persons[1]	1.4	2.7
White	1.1	2.6
Black	3.9	3.6
Reported by self	0.1	1.2
White	0.1	1.2
Black	0.1	1.4
Reported by other	3.1	4.5
White	2.5	4.3
Black	9.3	6.8

[1]Includes persons not reported on type of respondent, not shown separately.

[8] See U.S. Bureau of the Census, **Census of Population: 1970**, Vol. I, **"Characteristics of the Population,"** App-65-67, for a discussion of errors in age groups in the 1970 census.

Voting in previous elections. Failure to remember is not considered to be a problem in the voting survey for a current election, since the data in each survey are collected during the week containing the 19th day of November, which is generally about 2 weeks after the election. However, since 1968, questions have also been asked in each survey about whether respondents had voted in the previous Presidential election. Asking retrospective questions of this kind introduces possible memory biases into the data, and the net effect would be expected to be a further overstatement of voter participation. That effect is fairly small with regard to the 1976 and 1972 Presidential elections, as table E shows.[9] Some of the apparent changes in the voting rate shown in this table result from the combined effect of sampling differences and changes in the universe because of deaths, movement into and out of the Armed Forces or institutions, and international migration.

RELATED REPORTS

Current population reports. Advance data on reported voter participation and registration of the population of voting age, by race and sex, for the United States and regions in the November 1976 election are contained in the report Series P-20, No. 304.

Data on voter participation by social and economic characteristics of the population of voting age in the 1964, 1968, and 1972 Presidential elections and in the 1966, 1970, and 1974 Congressional elections were published in the reports Series P-20, Nos. 143, 192, 253, 174, 228, and 293, respectively.

Data on the social and economic characteristics of persons 18 to 24 years old who became eligible to vote on the basis of age in 1972 were published in **Current Population Reports,** Series P-20, No. 230.

Projections of the population of voting age for the United States, regions, divisions, and States for November 1, 1976 were published in **Current Population Reports,** Series P-25, No. 626.

Data on the social and economic characteristics by reported voter participation of the population of voting age in the 1966 and 1964 elections and estimates of the population of voting age for the United States, regions, divisions, and States, as of November 1, 1968, were published in a composite report Series P-20, No. 172.

The number of persons of voting age in 1960 and the votes cast for President in the elections of 1964 and 1960 for the United States, by States and counties, are contained in the report Series P-23, No. 14.

[9] See Current Population Reports, Series P-20, No. 293. "Voting and Registration in the Election of November 1974." table G, page 10 for a comparison of voting in 1972 and 1968 as reported in the year of the election and two years later.

NOTE

In the past the Census Bureau has designated a head of household to serve as the central reference person for the collection and tabulation of data for individual members of the household (or family). However, recent social changes have resulted in a trend toward recognition of more equal status for all members of the household (or family), making the term "head" less relevant in the analysis of household and family data. As a result, the Bureau is currently developing new techniques of enumeration and data presentation which will eliminate the concept of "head." While much of the data in this report are based on the concept of "head," methodology for future Census Bureau reports will reflect a gradual movement away from this traditional practice.

Appendix A

DEFINITIONS AND EXPLANATIONS

Population coverage. The data in this report were collected in conjunction with the November 1976 sample survey which covered the population of the 50 States and the District of Columbia. The figures shown relate to the civilian noninstitutional population.

Geographic regions. The four major regions of the United States, for which data are presented in this report, represent groups of States, as follows:

Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont.

North Central: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.

South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

West: Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

The North as used in this report includes the combined Northeast and North Central regions.

Geographic divisions. The nine major geographic divisions for which data are shown in this report represent groups of States as follows:

New England: Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont.

Middle Atlantic: New Jersey, New York, and Pennsylvania.

East North Central: Illinois, Indiana, Michigan, Ohio, and Wisconsin.

West North Central: Iowa, Kansas, Minnesota, Missouri, Nebraska, North Dakota, and South Dakota.

South Atlantic: Delaware, District of Columbia, Florida, Georgia, Maryland, North Carolina, South Carolina, Virginia, and West Virginia.

East South Central: Alabama, Kentucky, Mississippi, and Tennessee.

West South Central: Arkansas, Louisiana, Oklahoma, and Texas.

Mountain: Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah, and Wyoming.

Pacific: Alaska, California, Hawaii, Oregon, Washington.

Metropolitan-nonmetropolitan residence. The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England SMSA's consist of towns and cities, rather than counties. The metropolitan population in this report is based on SMSA's as defined in the 1970 census and does not include any subsequent additions or changes, other than the recognition of the Nassau-Suffolk, N.Y. SMSA as an area separate from the New York, N.Y. SMSA.

Central cities. Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities. If only one central city is designated, then it must have 50,000 inhabitants or more. The area title may include, in addition to the largest city, up to two city names on the basis and in the order of the following criteria: (1) The additional city has at least 250,000 inhabitants or (2) the additional city has a population of one-third or more of that of the largest city and a minimum population of 25,000. An exception occurs where two cities have contiguous boundaries and constitute, for economic and social purposes, a single community of at least 50,000, the smaller of which must have a population of at least 15,000.

Farm-nonfarm residence. The farm population refers to rural residents living on farms. The method of determining farm-nonfarm residence in the present survey and in the Current Population Surveys since March 1960 is the same as that used in the 1960 and 1970 censuses but differs from that used in earlier surveys and censuses. Since March 1960 in the Current Population Surveys, farm residence has been determined by the responses to two questions. Owners are asked "Does this place have 10 or more acres?" and renters are asked "Does the place you rent have 10 or more acres?" If the response is "Yes," the respondent is asked "During the past 12 months, did sales of crops, livestock, and other farm products from this place amount to $50 or more?" If the acreage response is "No," the inquiry relates to sales of $250 or more. Rural persons in motels and tourist camps

and those living on rented places where no land is used for farming, are not classified as farm population. The nonfarm population, as the term is used here, comprises persons living in urban areas and rural persons not on farms.

Although the method of determining farm-nonfarm residence has not changed since March 1960, the underlying sampling methods and estimation procedures have changed. For a discussion of changes, see **Employment and Earnings,** Volume 18, No. 8, February 1972, pp. 6-9, published by the Bureau of Labor Statistics.

Reported voter participation. Voter participation data for 1976 were derived from replies to the following question asked of all persons of voting age: "This month we have some questions about whether people voted in the November 2d general election. In any election some people are not able to vote because they are sick or busy, or have some other reason, and others do not want to vote. Did (this person) vote in the election held on November 2nd?"

Those of voting age were classified as "voted" or "did not vote." In most tables, this "did not vote" class includes those reported as "did not vote," "do not know if voted," and nonrespondents, but there are exceptions, which are properly noted in the tables where the "did not vote" class includes only those reported as "did not vote." Nonrespondents and persons who reported that they did not know if they voted were included in the "did not vote" class because of the general overreporting by respondents in the sample.

Data shown in this report on voting for President in 1972 were derived from questions asked in 1976. The question referring to 1972 was as follows: "Thinking back to 1972 did (this person) vote in the Presidential election in that year?"

Reason not voted. Data on reported reason for not voting were collected in the Current Population Survey by asking the following question of those persons who reported that they were registered but did not vote: "What was the main reason (this person) did not vote? Was it because (this person) was unable to vote, was not interested, or was there some other reason?"

The answer was recorded in one of the following categories:

Could not vote

What was the main reason (this person) was unable to vote?
Had no way to get to the polls
Illness or emergency
Couldn't take time off from work
Lines too long, machines not working
Out of town, or away from home
Other reason

Not interested

Which sentence best describes why (this person) didn't vote this year?
Did not prefer any of the candidates
Politicians are not interested in my problems
My vote would not make a difference in the election
Just don't want to get involved in politics
Not interested in the election this year
Other reason

Other reason

What was the main reason (this person) did not vote?
Just didn't get around to it, or forgot
Never do
Other reason
Don't know

Whether voted in person. Persons who reported that they voted were asked, "Did (this person) vote in person or by absentee ballot?" Responses were recorded as "In person," "Absentee ballot," or "Don't know."

Reported registration. The data shown on registration were obtained by tabulating replies to the following question for those persons included in the category "did not vote." "Was (this person) registered to vote in the November 2nd election?"

All persons reported as having voted were assumed to have been registered. Therefore, the total registered population is obtained by combining the number of persons who voted and persons included in the category "did not vote," but who had registered.

Persons eligible to register. The population of voting age includes a considerable number of persons who meet the age requirement but cannot register and vote. Only citizens are eligible to vote. Among citizens of voting age, some persons are not permitted to vote because they have been committed to penal institutions, mental hospitals, or other institutions, or because they fail to meet State and local resident requirements for various reasons. The eligibility to register is governed by State laws which differ in many respects.

Registration is the act of qualifying to vote by formally enrolling on a list of voters. With certain exceptions, such as for members of the Armed Forces and a few States which permit registration by mail, registration must be done in person. For the majority of States, registration is permanent, that is, once a person has enrolled as a voter his or her name remains on the list as long as he or she continues to vote in the same jurisdiction—usually at least once every two or four years. In a few States or parts of States, voters must register for each election in which they desire to vote. People who have moved to another election district must take steps to have their names placed on the voting rolls in their new place of residence.

In a few States or parts of States, no formal registration is required. Voters merely present themselves at the polling place on election day with proof that they are of age and have met the appropriate residence requirements. Therefore, in these areas persons who are citizens and of voting age, and who meet the residence requirements, would be considered as being registered.

Reason not registered. Data on reported reason for not registering to vote were collected in the Current Population Survey by asking the following question of those persons who reported that they had not registered to vote: "What was the main reason (this person) did not register? Was it because (this person) was unable to register, was not interested, or was there some other reason?"

Unable to register

What was the main reason (this person) was unable to register?

Not a United States citizen
Had not lived here long enough to be qualified to vote
Recently moved here, haven't had time
Permanent illness or disability
No transportation
Hours or place of registration inconvenient
Didn't know how or where to register
Can't read English
Other reason

Not interested

Which sentence best describes why (this person) did not register this year?

Did not prefer any of the candidates
Politicians are not interested in my problems
My vote would not make a difference in the election
Just don't want to get involved in politics
Not interested in the election this year
Other reason

Other reason

What was the main reason (this person) did not register?

Just didn't get around to it, or forgot
Didn't know I had to
Never do
Other reason
Don't know

Duration of residence. Data on duration of residence were obtained from replies to the following question: "How long has (this person) lived at this address?" The answer was recorded in one of the following categories:

Less than 1 month
1 to 6 months
7 to 11 months
1 to 2 years
3 to 5 years
6 to 9 years
10 years or more

Age. The age classification is based on the age of the person at the person's last birthday.

Race. The population is divided into three groups on the basis of race: White, Black, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except White and Black. In this report, "other races" are usually shown in combination with the Black population.

Persons of Spanish origin. Persons of Spanish origin in this report were determined on the basis of a question that asked for self-identification of the person's origin or descent. Respondents were asked to select their origin (or the origin of some other household member) from a "flash card" listing ethnic origins. Persons of Spanish origin, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Cuban, Central or South American, or some other Spanish origin.

Household. A household includes all of the persons who occupy a house, an apartment, or other group of rooms, or a room which constitutes a housing unit under the 1970 census rules. A group of rooms or a single room is regarded as a housing unit when it is occupied as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure, and when there is either (1) direct access from the outside or through a common hall, or (2) a kitchen or cooking equipment for the exclusive use of the occupants.

Family. The term "family," as used here, refers to a group of two persons or more related by blood, marriage, or adoption, and residing together; all such persons are considered as members of one family.

Primary family. The term "primary family" refers to the head of a household and all other persons in the household related to the head by blood, marriage, or adoption.

Marital status. The marital status classification identifies four major categories: single, married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category "married" is further divided into "married, spouse present," "separated," and "other married, spouse absent." A person was classified as "married, spouse present" if the husband or wife was reported as a member of the household, even though he or she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as separated included those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily separated because of marital discor . The group "other married, spouse absent" includes married persons living apart because either the husband or wife was employed, and living at a considerable distance from home, was serving away from home in the Armed Forces, had moved to another area, or had a different place of residence for any other reason except separation as defined above.

Married couple. A married couple, as defined for census purposes, is a husband and his wife enumerated as members of the same household. The married couple may or may not have children living with them. The expression "husband-wife" before the term "household," "family," or "subfamily" indicates that the household, family, or subfamily is maintained by a husband and wife. Tables which display data for characteristics of the head (e.g., age, sex, race) for households or families show characteristics of the husband in husband-wife households or families.

Head of household or family. According to current terminology used by the Bureau of the Census, one person in each household, family, or subfamily is designated as the "head." The number of such persons, therefore, is equal to the number of households, families, or subfamilies. This person is usually the person regarded as the head by the members of the group. Married women are not classified thus, if their husbands are living with them at the time of the survey.

The use of the term "head" in Census Bureau enumerations and publications has been criticized by a number of individuals and groups as being offensive, because of its hierarchical connotations, and not descriptive of the responsibility-sharing roles of members of households and families. Historically, the Bureau has primarily used the term "head" as a convenient way of determining relationships within households and families and of defining households and families by the characteristics of a single household member in data tables. These practices are currently being reviewed and efforts are underway to develop a suitable alternative which would be inoffensive and yet allow for the collection and publication of data on household and family characteristics on a basis which would keep the adverse effects on time-series comparisons to a minimum.

Unrelated individuals. Unrelated individuals are persons (other than inmates of institutions) who are not living with any relatives. An unrelated individual may be (1) a person living alone or with nonrelatives only, (2) a lodger or resident employee with no relatives in the household, or (3) a group quarters member who has no relatives living with him. Thus, a widow who occupies her house alone or with one or more other persons not related to her, a roomer not related to anyone else in the housing unit, a maid living as a member of her employer's household but with no relatives in the household, and a resident staff member in a hospital living apart from any relatives are all examples of unrelated individuals.

Years of school completed. In this report, data on years of school completed were derived from the combination of answers to two questions, (a) "What is the highest grade of school that the person has attended?" and (b) "Did the person finish this grade?"

The questions on educational attainment applied only to progress in "regular" schools. Such schools include public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, "regular" schooling is that which advances a person toward an elementary or high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

Labor force and employment status. The definitions of labor force and employment status in this report relate to the population 14 years old and over.

Employed. Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed persons are those civilians who, during the survey week, had no employment but were available for work and (1) had engaged in any specific jobseeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

Labor force. Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians classified as employed or unemployed.

Not in the labor force. All civilians who are not classified as employed or unemployed are defined as "not in the labor force." This group who are neither employed nor seeking work includes persons engaged only in own home housework, attending school, or unable to work because of long-term physical or mental illness; persons who are retired or too old to work, seasonal workers for whom the survey week fell in an off season, and the voluntary idle. Persons doing only unpaid family work (less than 15 hours) are also classified as not in the labor force.

Occupation and class of worker. The data on occupation of employed persons refer to the civilian job held during the survey week. Persons employed at two or more jobs were reported in the job at which they worked the greatest number of hours during the week.

The occupation groupings used here are mainly the major groups used in the 1970 Census of Population. The composition of these groups is shown in Volume 1, **Characteristics of the Population, Part 1, United States Summary,** chapter D. The categories used are either detailed classifications or combinations thereof.

The class-of-worker classification specifies "wage and salary workers" and "self-employed workers." Wage and salary workers received wages, salary, commissions, tips, pay in kind, or piece rates from a private employer or from a government unit. Self-employed workers have their own business, profession, or trade, or operate a farm for profit or fees. The self-employed include unpaid family workers.

Family income. Income as defined in this report represents the combined total money income of the family before deductions for personal taxes, Social Security, bonds, etc. It is the algebraic sum of money wages and salaries, net income from self-employment, and income other than earnings received by all family members during the 12 months prior to the November 1976 survey. It should be noted that, although the family income statistics refer to receipts during the previous 12 months, the characteristics of the person, such as age, labor force status, etc., and the composition of families refer to the date of the survey.

The income tables include in the lowest income group (under $5,000) those who were classified as having no income in the preceding 12 months and those reporting a loss in net income from farm and nonfarm self-employment or in rental income. Many of these were living on income "in kind," savings, or gifts; or were newly constituted families, or families in which the sole breadwinner had recently died or had left the household. However, many of the families who reported no income probably had some money income which was not recorded in the survey.

The income tables in this report includes a separate category for families for whom no income information was obtained. In most of the other Current Population Survey reports showing income data, the missing income data have been allocated.

The money income level of families shown in this report may be somewhat understated. Income data from the November control card are based on the respondent's estimate of total family money income for the preceding 12 months coded in broad, fixed income intervals. Income data collected in the March supplement to the Current Population Survey are based on responses to 8 direct questions asked for all persons 14 years old and over identifying 14 different sources of income and cover the preceding calendar year.

Previous research has shown that the use of broad income intervals to record money income tends to reduce the rate of nonreporting while increasing the likelihood that the amounts reported will be significantly understated as compared with results from more detailed questions.

Symbols. A dash "–" represents zero, and the symbol "Z" indicates that the figure is less than 0.05 percent. The symbol "B" means that the base for the derived figure is less than 75,000. Three dots "..." means not applicable, and "NA" means not available.

Rounding of estimates. Individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; with few exceptions, percentages are based on the unrounded numbers.

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of data. Most of the estimates in this report are based on data collected in November of 1964, 1972, and 1976 from the Current Population Survey. Also included in text table G are counts of official votes cast during the November elections of these years.

Current Population Survey (CPS). The monthly CPS deals mainly with labor force data for the civilian, noninstitutional population. Questions relating to labor force participation are asked about each member 14 years old and older in each sample household. In addition, supplemental questions are asked about voting and voter registration during the month of November in election years.

The present CPS sample was initially selected from the 1970 census file and is updated continuously to reflect new construction where possible (see section, "Nonsampling Variability," below). Previous sample designs used, as a basis, files from the census most recently completed at the time.

The following table provides a description of some aspects of the CPS sample designs in use during the referenced data-collection periods.

Description of the Current Population Survey

Time period	Number of sample areas[1]	Households eligible		Households visited, not eligible[2]
		Interviewed	Not interviewed	
November 1976.....	461	45,000	2,000	8,000
November 1972.....	461	45,000	2,000	8,000
November 1964.....	357	33,500	1,500	6,000

[1]These areas were chosen to provide coverage in each State and the District of Columbia.
[2]These are households which were visited but were found to be vacant or otherwise not eligible for interview.

The estimation procedure used for the monthly CPS data involves the inflation of weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates are based on statistics from decennial censuses; statistics on births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces.

Reliability of the estimates. Since the estimates in this report are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaires, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey—sampling and nonsampling. The standard errors provided for this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data. The full extent of nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

Nonsampling variability. As in any survey work, the results are subject to errors of response and nonreporting in addition to sampling variability. Nonsampling errors can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness to provide correct information on the part of respondents, inability to recall information, mistakes made in collection such as in recording or coding the data, mistakes made in processing the data, mistakes made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Overall undercoverage, as compared to the level of the decennial census, is about 5 percent. It is known that CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races than for Whites. Ratio estimation to independent age-sex-race population controls, as described previously, partially corrects for the bias due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics than interviewed persons in the same age-sex-race group. Further, the independent population controls used have not been adjusted for undercoverage in the 1970 census, which was estimated at 2.5 percent of the population with similar undercoverage differentials by age, sex, and race as observed in CPS.

The approximate magnitude of two sources of undercoverage of housing units is known. Of the 83,000,000 housing units in the U.S. about 600,000 new construction housing units other than mobile homes are not represented in the CPS sample because they were assigned building permits prior to the 1970 census, but building was not completed by the time of the census, (i.e., April 1970). Most conventional new construction, for which building permits were issued after the census, is represented. About 290,000 occupied mobile homes are not represented in CPS; these units were either missed in the census or have been built or occupied since the census. The extent of other sources of undercoverage of housing units is unknown but believed to be small. These estimates of missed units are relevant to the present sample only and not to earlier designs where the extent of undercoverage was generally less. Further sources of CPS nonsampling error peculiar to questions on voting and voter registration are discussed in the section, "Evaluation of the Accuracy of the Data."

Sampling variability. The standard errors given in the tables are primarily measures of sampling variability, that is, of the variations that occur by chance because a sample rather than the whole of the population is surveyed. The chances are about 68 out of 100 that an estimate from the survey differs from a complete census figure by less than the standard error. The chances are about 90 out of 100 that this difference would be less than 1.6 times the standard error and about 95 out of 100 that the difference would be less than twice the standard error.

All statements of comparison appearing in the text are significant at a 1.6 standard error level or better, and most are significant at a level of more than 2.0 standard errors. This means that for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by the phrase, "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

Standard errors for data based on official counts. The standard error associated with official counts may be assumed to be zero.

Note when using small estimates. Percent distributions are shown in the report only when the base is 75,000 or greater. Because of the large standard errors involved, there is little chance that percentages would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's needs.

Standard error tables and their use. In order to derive standard errors that would be applicable to a large number of estimates and could be prepared at a moderate cost, a number of approximations were required. Therefore, instead of providing a standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result, the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error.

The figures presented in tables A-1 and A-4 provide approximations to standard errors of various estimates for total or White persons; tables A-2 and A-5 provide approximations to standard errors of estimates for Black persons; and tables A-3 and A-6 provide approximations to standard errors for estimates involving residence or regions. Estimated standard errors cannot be obtained from tables A-1 through A-6 without the use of the appropriate factors in tables A-7 or A-8. These factors must be applied to the generalized standard errors in order to adjust for the combined effect of sample design and the estimating procedure on the value of the characteristic. The standard error tables with which each factor should be used are indicated in tables A-7 and A-8. Standard errors for intermediate values not shown in the generalized tables of standard errors may be approximated by interpolation.

Two parameters are used (denoted "a" and "b") to calculate standard errors for each type of characteristic; they are presented in tables A-7 and A-8. These parameters were used to calculate the standard errors in tables A-1 through A-6 and the factors in tables A-7 and A-8. They also may be used to calculate the standard errors for estimated numbers and estimated percentages directly. Direct computation of the standard errors will give more accurate results than the use of the standard error tables and the factors in tables A-7 or A-8. Methods for direct computation are given in the following sections.

Standard errors of estimated numbers. The approximate standard error, σ_x, of an estimated number shown in this report can be obtained in two ways. It may be obtained by use of the formula

$$\sigma_x = f\sigma \qquad (1)$$

where f is the appropriate factor from table A-7 or A-8, and σ is the standard error on the estimate obtained by interpolation from table A-1, A-2, or A-3. Alternately, standard errors may be approximated by the following formula (2), from which the standard errors were calculated in tables A-1, A-2, and A-3. Use of this formula will provide more accurate results than the use of formula (1) above.

$$\sigma_x = \sqrt{ax^2 + bx} \qquad (2)$$

Here x is the size of the estimate and a and b are the parameters in table A-7 or A-8 associated with the particular type of characteristic.

Standard errors of estimated percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends on both the size of the percentage and the size of the total upon which this percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameters indicated by the numerator. The approximate standard error, $\sigma_{(x,p)}$, of an estimated percentage can be obtained by use of the formula

$$\sigma_{(x,p)} = f\sigma \qquad (3)$$

In this formula f is the appropriate factor from table A-7 or A-8 and σ is the standard error on the estimate from table A-4, A-5, or A-6. Alternately, standard errors may be approximated by the following formula (4) from which the standard errors in tables A-4, A-5, and A-6 were calculated; direct computation will give more accurate results than use of the standard error tables and the factors.

$$\sigma_{(x,p)} = \sqrt{\frac{b}{x} \cdot p\,(100 - p)} \qquad (4)$$

Here x is the size of the subclass of persons which is the base of the percentage, p is the percentage ($0 \leq p \leq 100$), and b is the parameter in table A-7 or A-8 associated with the particular type of characteristic in the numerator of the percentage.

Illustration of use of standard error tables. Table 8 of this report shows that 12,755,000 never-married persons voted in the election of November 1976. Table A-1 shows the approximate standard error of an estimate of this size is 165,000. The appropriate factor to apply from table A-7 is 1.2 so the standard error is approximately 1.2 x 165,000 = 198,000. The chances are 68 out of 100 that the estimate would have been a figure differing from a complete census figure by less than 198,000. The chances are 95 out of 100 that the estimate would have differed from a complete census figure by less than 396,000 (twice the standard error). Alternatively, using formula (2) with parameters a = 0.000017 and b = 3500 gives an estimate of the standard error of 205,000.

Of these 12,755,000 never-married persons who voted, 6,174,000, or 48.4 percent, were female. From table A-7 the appropriate b parameter for computing standard errors is 3500; using formula (4), the standard error on an estimate of 48.4 percent is

$$\sqrt{\frac{3500}{12{,}755{,}000}\,48.4\,(100 - 48.4)} \doteq 0.8 \text{ percent}$$

Consequently, chances are 68 out of 100 that the estimated 48.4 percent would be within 0.8 percentage points of a complete census figure. Chances are 95 out of 100 that the estimate would be within 1.6 percentage points of a complete census figure; i.e., the 95 percent confidence interval would be from 46.8 to 50.0 percent. As an alternative, tables A-4 and A-7 can be used to get an estimated standard error of 1.2 x 0.74 = 0.9 percent on the estimate of 48.4 percent.

[1]Persons of Spanish origin may be of any race.
[2]Persons 21 years old and over.

Standard error of a difference. For a difference between two sample estimates, the standard error is approximately equal to

$$\sigma_{(x-y)} \doteq \sqrt{\sigma_x^2 + \sigma_y^2} \qquad (5)$$

where σ_x and σ_y are the standard errors of the estimates x and y; the estimates can be of numbers, percents, averages, etc. This will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between two separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will overestimate the true standard error.

Illustration of the computation of the standard error of a difference. Table 2 of this report shows that in the November 1976 election there were 3,649,000 Black voters in the South and 1,692,000 Black voters in the North Central U.S. for an estimated difference of 1,957,000 voters between the two regions.

Using formula (2) and the appropriate parameters from table A-7, the standard error on the estimate of 3,649,000 voters is approximately 149,000. Similarly, the approximate standard error on the estimate of 1,692,000 voters is 102,000. Therefore, from formula (5) the approximate standard error on the estimated difference of 1,957,000 persons is

$$181{,}000 \doteq \sqrt{(149{,}000)^2 + (102{,}000)^2}$$

This means the chances are 68 out of 100 that the estimated difference based on the sample estimates would vary from the difference derived using complete census figures by less than 181,000 persons. The 68 percent confidence interval about the 1,957,000 persons difference is from 1,776,000 to 2,138,000, i.e., 1,957,000 $\pm$ 181,000. A conclusion that the average estimate of the difference derived from all possible samples of the same size and design lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. The 95 percent confidence interval is 1,595,000 to 2,319,000. Since this interval does not include zero, we can conclude with 95 percent confidence that there was a significant difference in the numbers of Black voters in the South and in the North Central U.S. in November 1976.

Appendix B

November Voting Supplement Questionnaire

[redacted]

34. Interviewer Check Item
This person is 18 years old or older ○ (Ask 35)
All others ○ (Go to next person)

This month we have some questions about whether people voted in the November 2nd General election. In any election some people are not able to vote because they are sick or busy, or have some other reason, and others do not want to vote.

35. Did . . . vote in the election held on November 2nd?
Voted ○ (Ask 36) ■ Did not vote ○ / Don't know ○ \ (Skip to 38)

36. Did . . . vote in person or by absentee ballot?
In person ○ / Absentee ballot ○ / Don't know ○ \ (Ask 37)

37. Did . . . vote for someone for President?
Yes ○ / No ○ / Don't know ○ \ (Skip to 42)

38. Was . . . registered to vote in the November 2nd election?
Yes ○ (Skip to 40)
No ○ (Ask 39)
Don't know ○ (Skip to 41)

39. What was the main reason . . . did not register? Was it because . . . was unable to register, was not interested or was there some other reason?

UNABLE TO REGISTER

What was the main reason . . . was unable to register?
(Mark one circle)

■
○ Not a United States citizen (Skip to 40)
(Skip to 41)
○ He / not lived here long enough to be qualified to vote
○ Recently moved here, haven't had time
○ Permanent illness or disability
○ No transportation
○ Hours or place of registration inconvenient
○ Didn't know how or where to register
○ Can't read English
○ Other reason

NOT INTERESTED

Which sentence best describes why . . . did not register this year?
(Show FL-43(C)-6(D) and mark one circle)

■
(Skip to 41)
○ Did not prefer any of the candidates
○ Politicians are not interested in my problems
○ My vote would not make a difference in the election
○ Just don't want to get involved in politics
○ Not interested in the election this year
○ Other reason

OTHER REASON

What was the main reason . . . did not register?
(Mark one circle)

■
(Skip to 41)
○ Just didn't get around to it, or forgot
○ Didn't know I had to
○ Never do
○ Other reason
○ Don't know

40. What was the main reason . . . did not vote? Was it because . . . was unable to vote, was not interested or was there some other reason?

UNABLE TO VOTE

What was the main reason . . . was unable to vote?
(Mark one circle)

■
(Ask 42)
○ Had no way to get to the polls
○ Illness or emergency
○ Couldn't take time off from work
○ Lines too long, machines not working
○ Out of town, or away from home
○ Other reason

NOT INTERESTED

Which sentence best describes why . . . didn't vote this year?
(Show FL-43(C)-6(D) and mark one circle)

■
(Ask 42)
○ Did not prefer any of the candidates
○ Politicians are not interested in my problems
○ My vote would not make a difference in the election
○ Just don't want to get involved in politics
○ Not interested in the election this year
○ Other reason

OTHER REASON

What was the main reason . . . did not vote?
(Mark one circle)

■
(Ask 42)
○ Just didn't get around to it, or forgot
○ Never do
○ Other reason
○ Don't know

41. Was . . . ever voted in a national, state, or local election?
Yes ○ (Ask 42)
No ○ / Don't know ○ \ (Skip to 46)

42. When was the last time . . . voted?
■
1976 or later ○ (Ask 43)
1974 ○ / 1972–1973 ○ / Don't know ○ \ (Skip to 46)
Before 1972 ○ / Don't know ○ \ (Skip to 46)

43. Did . . . vote earlier this year in a primary election to determine the candidate for Congress or President?
Yes ○ / No ○ / Don't know ○ \ (Ask 44)

44. Thinking back to 1972, did . . . vote in the presidential election in that year?
Yes ○ / No ○ / Don't know ○ \ (Ask 45)

45. How long has . . . lived at this address?
■
Less than 1 month ○
1–6 months ○
7–11 months ○
1–2 years ○
3–5 years ○
6–9 years ○
10 years or more ○
(Fill Item 46)

46. Interviewer Check Item
Who reported on voting for this person?
■
Self ○
Other ○
